

PORUS[®] ONE

For the support of feline kidney health

Key Feature #1:

Porus[®] One binds protein byproducts in the intestines where they are then excreted in the feces. As a result, the byproducts cannot be converted into uremic toxins.

Its Benefit:

Reducing uremic toxin production supports kidney health.

Key Feature #2:

Porus[®] One has no metabolism or absorption. It is excreted in the feces and there is no accumulation in the body.

Its Benefit:

It is generally well tolerated.

Key Feature #3:

Porus[®] One has no taste or smell and is readily accepted by cats.

Its Benefit:

It's very palatable and can be easily administered once daily at mealtimes.

How does Porus[®] One work?

Porus One binds protein byproducts in the intestines where they are then excreted in the feces.* As a result, the byproducts cannot be converted into uremic toxins.

Reducing uremic toxin production supports kidney health

Has Porus One been studied?

In an 8-week study of 18 healthy geriatric cats (11-16 years of age):

- 12 cats received 500 mg Porus One daily
- 6 cats served as negative control
- All cats on same type of food

The mean serum indoxyl sulfate concentration was reduced by more than 60% in the Porus One group while no significant change was observed in the control group.**

CHECK-OFF &
ECHO NOTES

State the Issue:

Ms. Armstrong, my exam revealed that your cat Sally is showing signs of poor kidney function.

State the Solution:

Porus One is a supplement for cats that is tasteless and odorless. It can be easily administered to Sally once daily at mealtime. It binds protein byproduct in her intestines where they can then be excreted into her feces. This binding process helps prevent the byproducts from having to go through her kidneys and supports overall kidney health.

Make Your Recommendation:

Ms. Armstrong, I believe Porus One will be an important tool to help support Sally's kidney health. Do you have any questions?
